

# Managing security in AWS

Viral Desai, AWS Solutions Architect

[virdesai@amazon.com](mailto:virdesai@amazon.com)

10/16/2018

# The most sensitive workloads run on AWS

"We determined that security in AWS is superior to our on-premises data center across several dimensions, including patching, encryption, auditing and logging, entitlements, and compliance."

—John Brady, CISO, FINRA (Financial Industry Regulatory Authority)

"The fact that we can rely on the AWS security posture to boost our own security is really important for our business. AWS does a much better job at security than we could ever do running a cage in a data center."

— Richard Crowley, Director of Operations, Slack

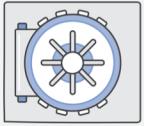

"With AWS, DNAexus enables enterprises worldwide to perform genomic analysis and clinical studies in a secure and compliant environment at a scale not previously possible."

— Richard Daly, CEO DNAexus

# Security is Job ZERO at AWS

## Strengthen your security posture

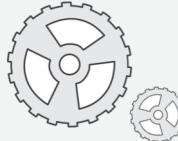

Inherit  
global  
security and  
compliance  
controls

Scale with  
superior visibility  
and control

Highest  
standards  
for privacy  
and data  
security

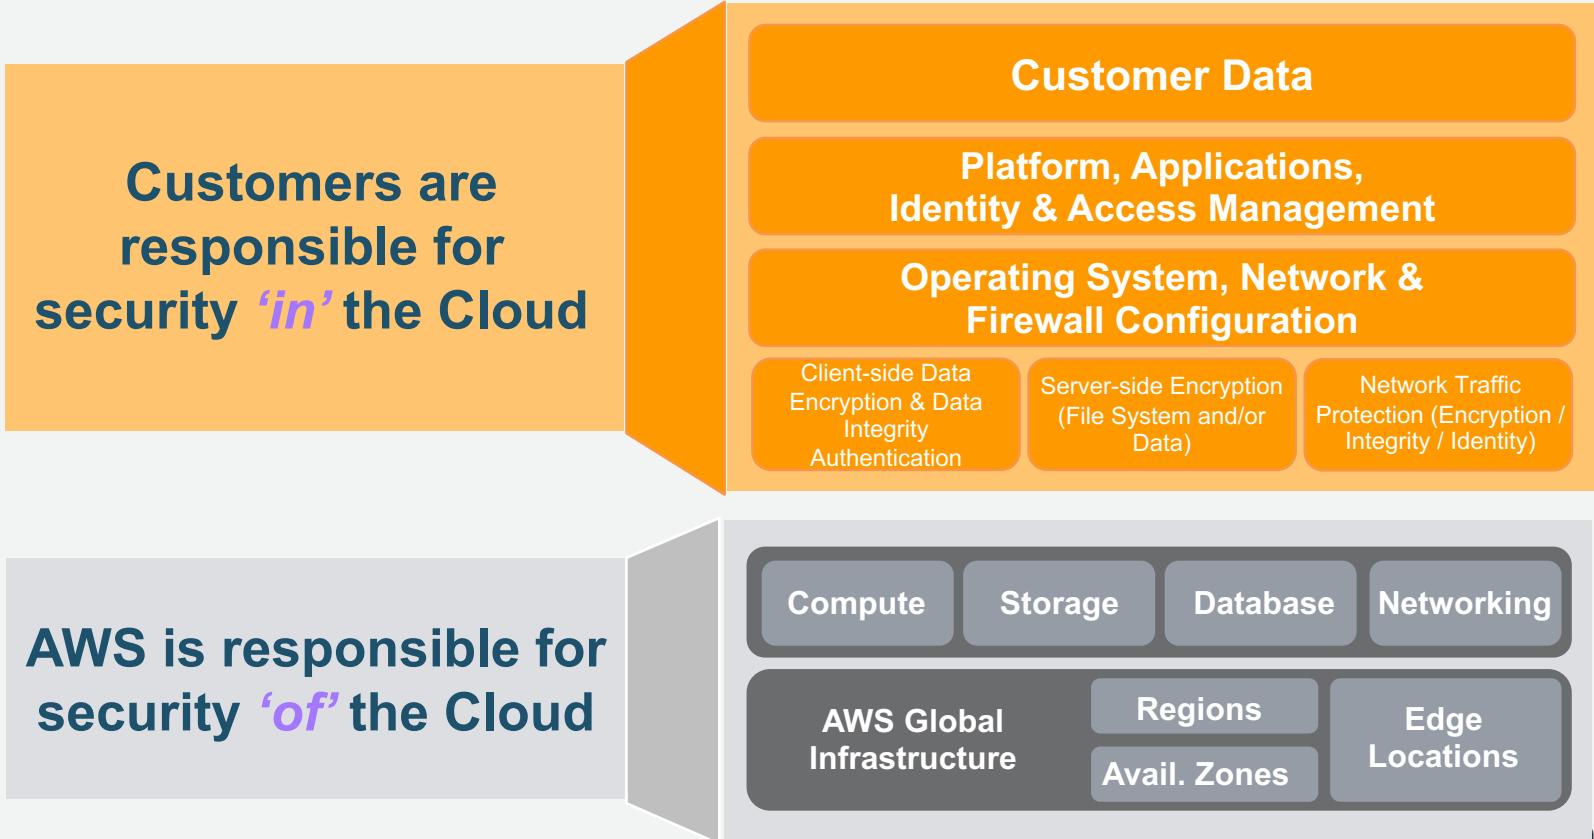

Automate  
with deeply  
integrated  
security services

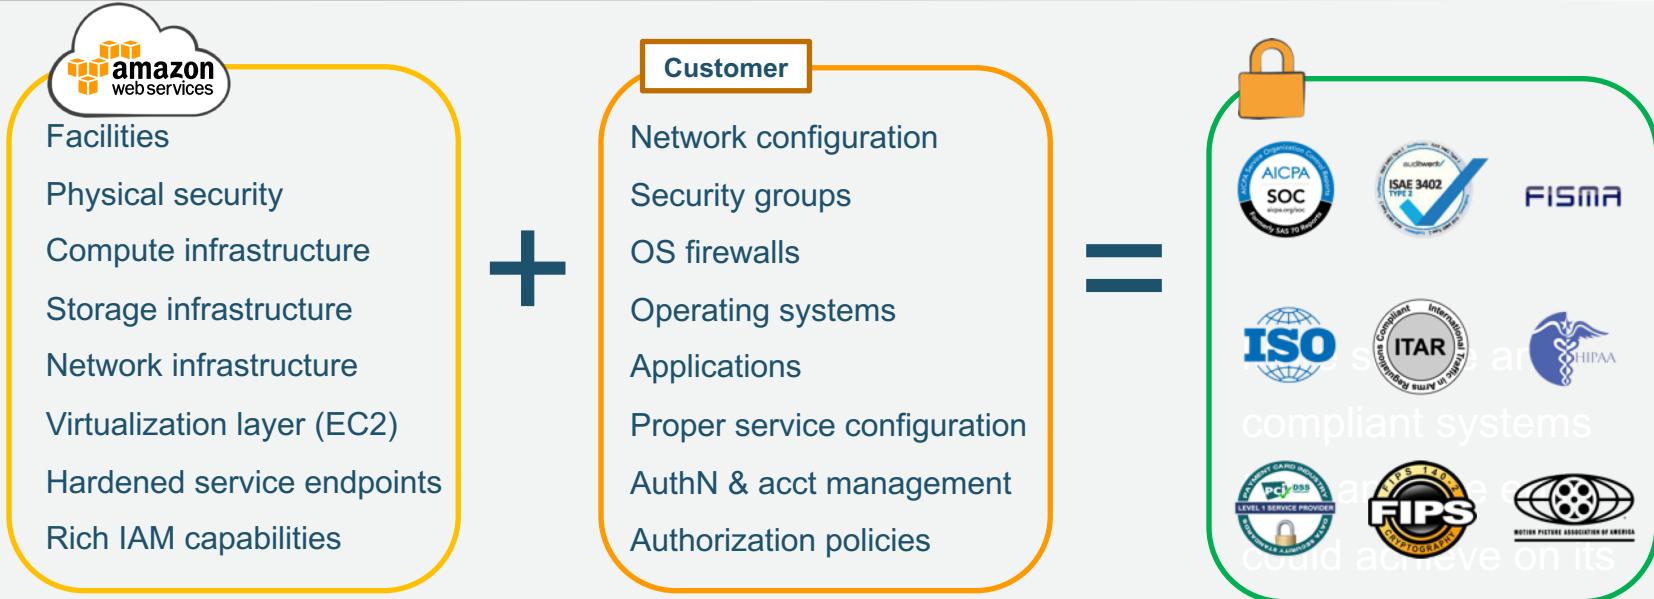

Largest  
network  
of security  
partners and  
solutions

# The AWS Shared Responsibility

*Hopefully, you've seen this before...*

# AWS Shared Responsibility Model

- Scope of responsibility depends on the type of service offered by AWS:  
**Infrastructure, Container, Abstracted Services**
- Understanding who is responsible for what is critical to ensuring your AWS data and systems are secure!

# Access a deep set of cloud security tools

# What does this mean?

- 💡 You benefit from an environment built for the most security sensitive organizations
- 💡 AWS manages a multitude of security controls **so you don't have to**
- 💡 You get to define the right security controls for your workload sensitivity
- 💡 You always have full ownership and control of your data

# Identity and Access Management (IAM)

# Policy specification basics

JSON-formatted documents

Contain a statement (permissions) that specifies:

- Which actions a principal can perform
- Which resources can be accessed

```
{  
  "Statement": [  
    {  
      "Effect": "effect",  
      "Principal": "principal",  
      "Action": "action",  
      "Resource": "arn",  
      "Condition": {  
        "condition": {  
          "key": "value" }  
      }  
    }  
  ]  
}
```

Principal  
Action  
Resource  
Condition

You can have multiple statements and each statement is comprised of PARC.

# Policy specification basics

JSON-formatted documents

Contain a statement (permissions) that specifies:

- Which actions a principal can perform
- Which resources can be accessed

```
{  
  "Statement": [  
    {  
      "Effect": "effect",  
      "Principal": "principal",  
      "Action": "action",  
      "Resource": "arn",  
      "Condition": {  
        "condition": {  
          "key": "value" }  
      }  
    }  
  ]  
}
```

Principal  
Action  
Resource  
Condition

You can have multiple statements and each statement is comprised of PARC.

Principal  
Action  
Resource  
Condition

# Principal – Examples

- An entity that is allowed or denied access to a resource
- Indicated by an Amazon Resource Name (ARN)
- With IAM policies, the principal element is implicit (i.e., the user, group, or role attached)

<!-- Everyone (anonymous users) -->

```
"Principal": "AWS": "*.*"
```

<!-- Specific account or accounts -->

```
"Principal": {"AWS": "arn:aws:iam::123456789012:root" }
```

```
"Principal": {"AWS": "123456789012" }
```

<!-- Individual IAM user -->

```
"Principal": "AWS": "arn:aws:iam::123456789012:user/username"
```

<!-- Federated user (using web identity federation) -->

```
"Principal": {"Federated": "accounts.google.com"}
```

<!-- Specific role -->

```
"Principal": {"AWS": "arn:aws:iam::123456789012:role/rolename"}
```

<!-- Specific service -->

```
"Principal": {"Service": "ec2.amazonaws.com"}
```

Replace  
with your  
account  
number

Principal  
Action  
Resource  
Condition

# Action – Examples

- Describes the type of access that should be allowed or denied
- You can find actions in the docs or use the policy editor to get a drop-down list
- Statements must include either an Action or NotAction element

```
<!-- EC2 action -->  
"Action":"ec2:StartInstances"
```

```
<!-- IAM action -->  
"Action":"iam:ChangePassword"
```

```
<!-- Amazon S3 action -->  
"Action":"s3:GetObject"
```

```
<!-- Specify multiple values for the Action element-->  
"Action":["sns:SendMessage", "sns:ReceiveMessage"]
```

```
<-- Wildcards (*) or (?) in the action name. Below covers create/delete/list/update-->  
"Action":"iam:*AccessKey*"
```

# Understanding NotAction

- Lets you specify an exception to a list of actions
- Could result in shorter policies than using Action and exclude many actions
- Example: Let's say you want to allow everything but IAM APIs

```
{  
  "Version": "2012-10-17",  
  "Statement": [ {  
    "Effect": "Allow",  
    "NotAction": "iam:*",  
    "Resource": "*"  
  }]  
}
```

Is there a difference?

```
{  
  "Version": "2012-10-17",  
  "Statement": [ {  
    "Effect": "Allow",  
    "Action": "*",  
    "Resource": "*"  
  },  
  {  
    "Effect": "Deny",  
    "Action": "iam:*",  
    "Resource": "*"  
  }]  
}
```

# Understanding NotAction

- Lets you specify an exception to a list of actions
- Could result in shorter policies than using Action and exclude many actions
- Example: Let's say you want to allow everything but IAM APIs

```
{  
  "Version": "2012-10-17",  
  "Statement": [ {  
    "Effect": "Allow",  
    "NotAction": "iam:*",  
    "Resource": "*"  
  } ]  
}
```

This is not a **Deny**. A user could still have a separate policy that grants **IAM:\***

Is there a difference?

```
{  
  "Version": "2012-10-17",  
  "Statement": [ {  
    "Effect": "Allow",  
    "Action": "*",  
    "Resource": "*"  
  },  
  {  
    "Effect": "Deny",  
    "Action": "iam:*",  
    "Resource": "*"  
  } ]  
}
```

If you want to prevent the user from ever being able to call IAM APIs, use an explicit **Deny**.

# Policy specification basics

JSON-formatted documents

Contain a statement (permissions) that specifies:

- Which actions a principal can perform
- Which resources can be accessed

```
{  
  "Statement": [  
    {  
      "Effect": "effect",  
      "Principal": "principal",  
      "Action": "action",  
      "Resource": "arn",  
      "Condition": {  
        "condition": {  
          "key": "value" }  
      }  
    }  
  ]  
}
```

Principal  
Action  
Resource  
Condition

You can have multiple statements and each statement is comprised of PARC.

# Resource – Examples

Principal  
Action  
Resource  
Condition

- The object or objects being requested
- Statements must include either a Resource or a NotResource element

```
<-- S3 bucket -->  
"Resource": "arn:aws:s3:::my_corporate_bucket/*"
```

```
<-- All S3 buckets, except this one -->  
"NotResource": "arn:aws:s3:::security_logging_bucket/*"
```

```
<-- Amazon SQS queue-->  
"Resource": "arn:aws:sqs:us-west-2:123456789012:queue1"
```

```
<-- Multiple Amazon DynamoDB tables -->  
"Resource": ["arn:aws:dynamodb:us-west-2:123456789012:table/books_table",  
            "arn:aws:dynamodb:us-west-2:123456789012:table/magazines_table"]
```

```
<-- All EC2 instances for an account in a region -->  
"Resource": "arn:aws:ec2:us-east-1:123456789012:instance/*"
```

Replace  
with your  
account  
number

# Condition example

Principal  
Action  
Resource  
Condition

What if you wanted to restrict access to a time frame and IP address range?

```
“Condition” : {  
    "DateGreaterThan" : {"aws:CurrentTime" : "2017-01-01T11:00:00Z"},  
    "DateLessThan": {"aws:CurrentTime" : "2017-12-31T15:00:00Z"},  
    "IpAddress" : {"aws:SourceIp" : ["192.0.2.0/24", "203.0.113.0/24"]}  
}
```

AND

OR

- Allows a user to access a resource under the following conditions:
  - The time is after 11:00 A.M. on 01/01/2017 AND
  - The time is before 3:00 P.M. on 12/31/2017 AND
  - The request comes from an IP address in the 192.0.2.0 /24 OR 203.0.113.0 /24 range

All of these conditions must be met in order for the statement to evaluate to  TRUE

# The anatomy of a policy with variables

```
{  
  "Version": "2012-10-17",  
  "Statement": [  
    {"Effect": "Allow",  
     "Action": ["s3>ListBucket"],  
     "Resource": ["arn:aws:s3:::myBucket"],  
     "Condition":  
       {"StringLike":  
         {"s3:prefix": ["home/${aws:username}/*"]}  
       }  
    },  
    {  
      "Effect": "Allow",  
      "Action": ["s3:*"],  
      "Resource": ["arn:aws:s3:::myBucket/home/${aws:username}",  
                  "arn:aws:s3:::myBucket/home/${aws:username}/*"]  
    }  
  ]  
}
```

Grants a user access to a home directory in S3 that can be accessed programmatically

© 2017, Amazon Web Services, Inc. or its Affiliates. All rights reserved.

# Controlling access to EC2

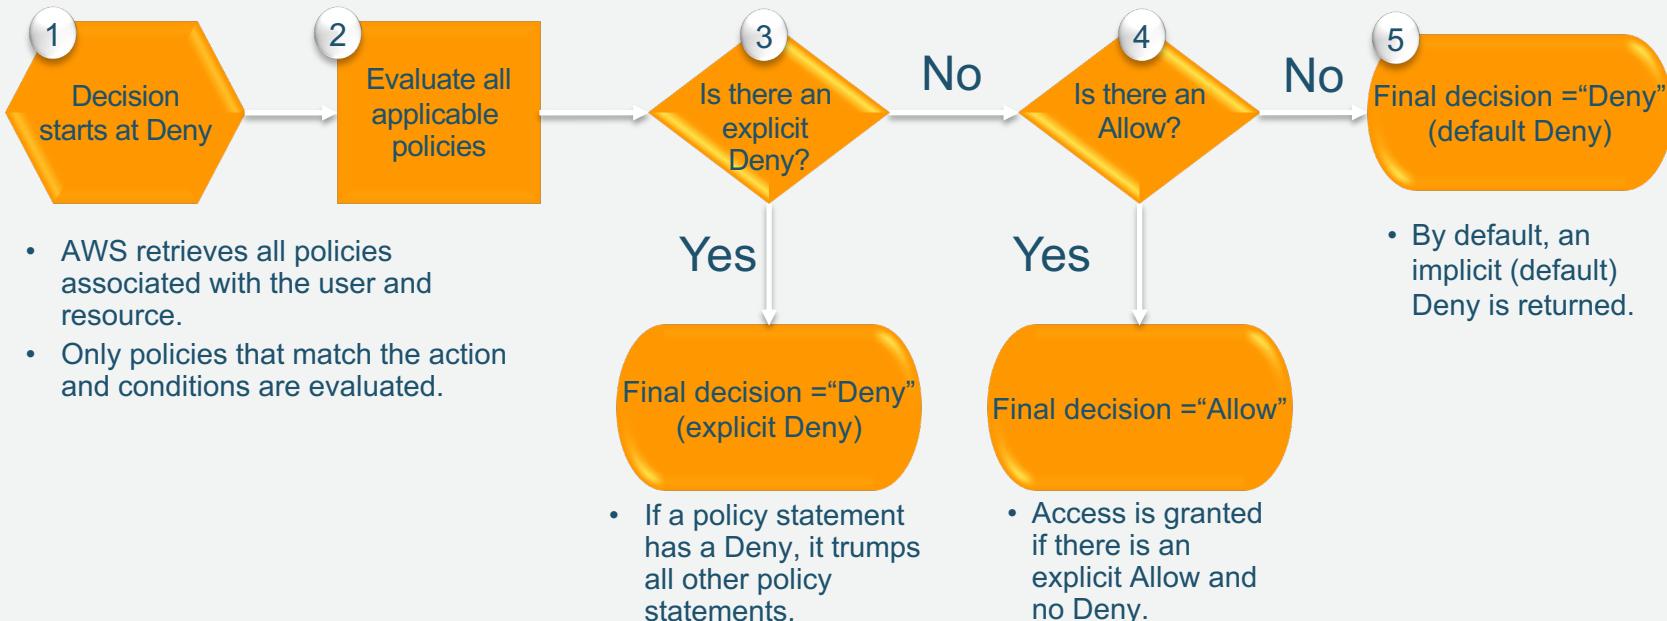

```
{  
    "version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:RebootInstances",  
                "ec2:RunInstances",  
                "ec2:StartInstances",  
                "ec2:StopInstances",  
                "ec2:TerminateInstances"  
            ],  
            "Condition": {  
                "stringLikeIfExists": {  
                    "ec2:Region": [ "us-east-1", "us-west-2" ],  
                    "ec2:InstanceType": [ "t1.*", "t2.*", "m3.*" ]  
                }  
            },  
            "Resource": "*"  
        }  
    ]  
}
```

Basic policy hygiene

Basic control actions for EC2

Use of `IfExists` makes sure your policy works the way you expect it to.

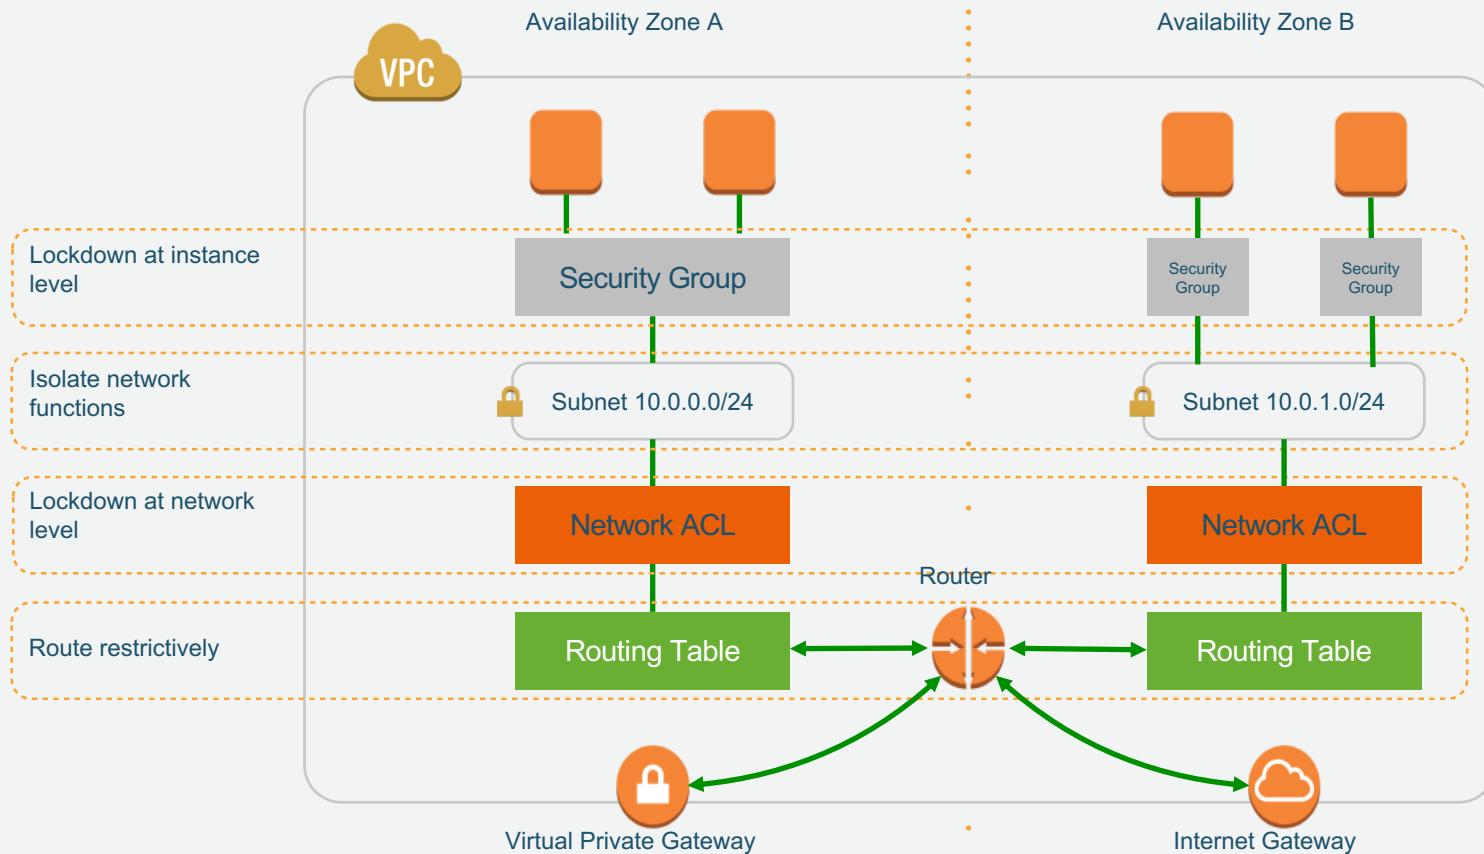

# Policy enforcement

-  Lock away your AWS account access keys
-  Create individual IAM users
-  Use groups to assign permissions to IAM users
-  Grant least privilege
-  Configure a strong password policy for your users
-  Enable MFA for privileged users
-  Use roles for applications that run on Amazon EC2 instances
-  Delegate by using roles instead of by sharing credentials
-  Rotate credentials regularly
-  Remove unnecessary credentials
-  Use policy conditions
-  Keep an audit log

# How do you secure the network in AWS?

# VPC security layers

# How are you currently encrypting your data?

# Encryption

*Protecting data in-transit and at-rest.*

## Encryption In-Transit

HTTPS

SSL/TLS

VPN / IPSEC

SSH

## Encryption At-Rest

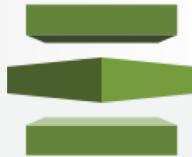

Object

Database

Filesystem

Disk

*Details about encryption can be found in the AWS Whitepaper,  
[“Securing Data at Rest with Encryption”](#).*

Provision **trusted SSL/TLS certificates** from AWS for use with integrated AWS resources

- 🔑 Elastic Load Balancing
- 🔑 Amazon CloudFront distributions
- 🔑 APIs on API Gateway

**AWS handles** the muck

- 🔑 Key pair and CSR generation
- 🔑 Managed renewal and deployment

**Domain validation (DV) through email**

## Domain names

- Single domain name: www.example.com
- Wildcard domain names: \*.example.com
- Combination of wildcard and non-wildcard names
- Multiple domain names in the same certificate (up to 10)

## ACM-provided certificates are managed

- Private keys are generated, protected, and managed
- ACM-provided certificates cannot be used on Amazon EC2 instances or on-premises servers
- Can be used with AWS services, such as Elastic Load Balancing and Amazon CloudFront, API Gateway

## Algorithms

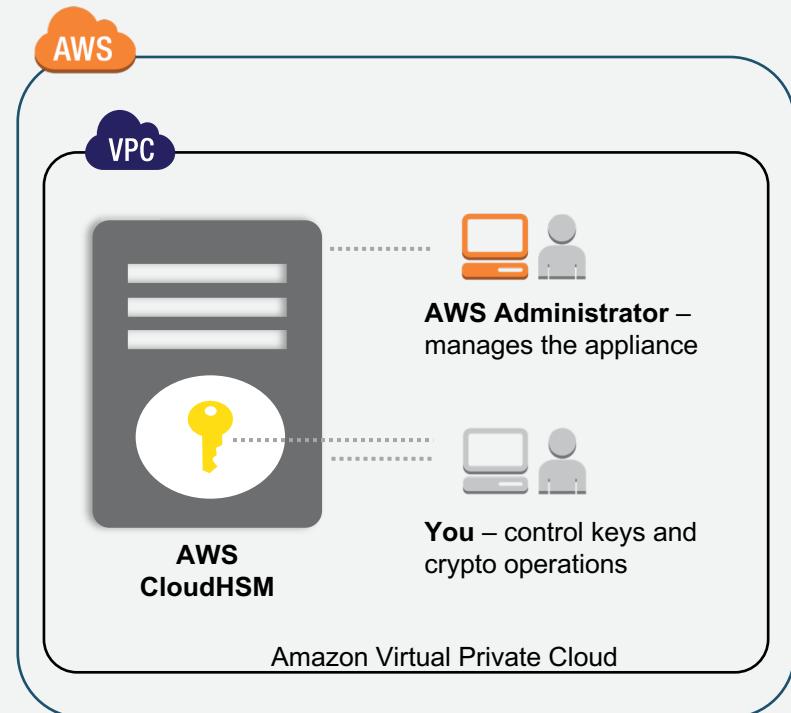

- RSA 2048 and SHA-256

Free

*Help meet compliance requirements for data security by using a dedicated Hardware Security Module appliance with AWS.*

- Dedicated, single-tenant hardware device
- Can be deployed as HA and load balanced
- Customer use cases:
  - Oracle TDE
  - MS SQL Server TDE
  - Setup SSL connections
  - Digital Rights Management (DRM)
  - Document Signing

- Managed service that simplifies creation, control, rotation, deletion, and use of encryption keys in your applications
- Integrated with 19 AWS services for server-side encryption
- Integrated with AWS service clients/SDKs
  - S3, EMRFS, DynamoDB, AWS Encryption SDK
- Integrated with CloudTrail to provide auditable logs of key usage for regulatory and compliance activities
- Available in all commercial regions except China

# Encryption at Rest

## Volume Encryption

EBS Encryption

Filesystem Tools

AWS Marketplace/Partner

## Object Encryption

S3 Server Side  
Encryption (SSE)

S3 SSE w/ Customer  
Provided Keys

Client-Side Encryption

## Database Encryption

RDS  
MSSQL  
TDE

RDS  
ORACLE  
TDE/HSM

RDS  
MYSQL  
KMS

RDS  
PostgreSQL  
KMS

Redshift  
Encryption

# KMS integration with AWS services

- **Storage:** EBS, S3, Snowball, ECS
- **Database:** All RDS engines, DMS
- **Data analytics:** Redshift, EMR, Kinesis Firehose
- **Enterprise apps:** WorkMail, WorkSpaces
- **Developer tools:** AWS CodeCommit, AWS CodePipeline
- **Management:** CloudTrail, CloudWatch Logs
- **App svcs:** Elastic Transcoder, Simple Email Service, CloudSearch
- **AWS IoT**

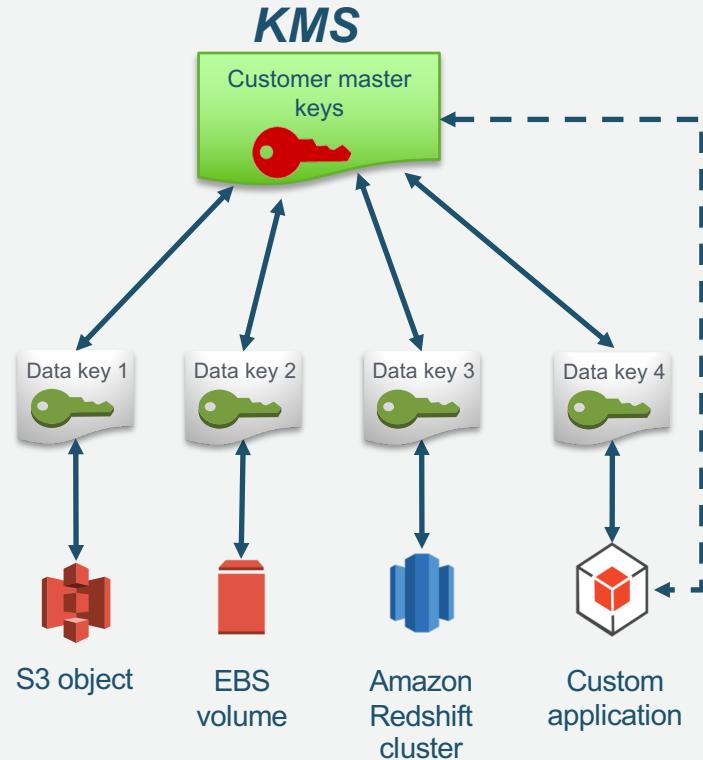

# How clients and AWS services typically integrate with KMS

Two-tiered key hierarchy using envelope encryption

- Unique data key encrypts customer data
- KMS master keys encrypt data keys

Benefits

- Limits risk of compromised data key
- Better performance for encrypting large data
- Easier to manage small number of master keys than millions of data keys
- Centralized access and audit of key activity

## Console (Key Summary page)

### ▼ Key Rotation

Rotate this key every year after its creation date. [Learn More.](#)

## AWS CLI

```
enable-key-rotation --key-id <value>
```

What key rotation means:

- A new version of a master key is created, but mapped to the same key ID (or alias)
- New encryption requests use the new version
- Previous versions of master keys are kept to perform decryption on older ciphertexts
- No version management needed by you – the same key ID or alias just works

# Auditability of KMS key usage through AWS CloudTrail

"EventName": "DecryptResult",

This KMS API action was called...

"EventTime": "2014-08-18T18:13:07Z",

....at this time

"RequestParameters":

  "\"keyId\": \"2b42x363-1911-4e3a-8321-6b67329025ex\"", ...in reference to this key

"EncryptionContext": "volumeid-12345",

...to protect this AWS resource

"SourceIPAddress": "203.0.113.113",

...from this IP address

"UserIdentity":

  "\"arn\": \"arn:aws:iam:: 111122223333:user/User123\""}

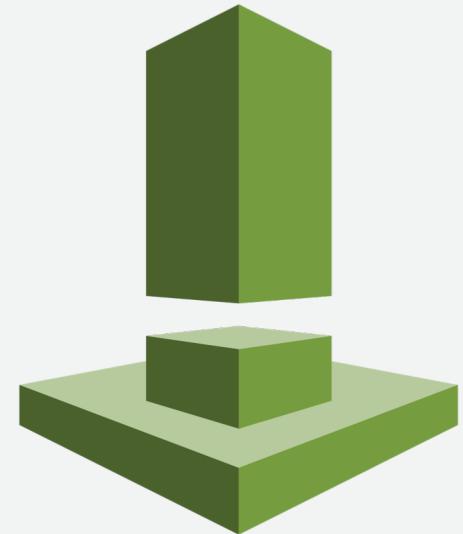

...by this AWS user in this account

 Bring Your Own Key

- You control how master keys are generated
- You store the master copy of the keys
- You import the key into KMS and set an optional expiration time in the future
- You can use imported keys with all KMS-integrated services
- You can delete and re-import the key at any time to control when AWS can use it to encrypt/decrypt data on your behalf
- Works with standards-based key management infrastructure, including SafeNet Gemalto and Thales e-Security

- **Vulnerability Assessment Service**
  - Built from the ground up to support DevSecOps
  - Automatable via APIs
  - Integrates with CI/CD tools
  - On-Demand Pricing model
  - Static & Dynamic Rules Packages
  - Generates Findings

### Web Traffic Filtering with Custom Rules

Create custom rules that can block, allow or monitor requests based on IP address, HTTP headers, or a combination of both.

### Malicious Request Blocking

AWS WAF can recognize and block common web application security risks like SQL injection (SQLi) and cross-site scripting (XSS).

### Active monitoring & tuning

Monitor and configure the requests that are being blocked and allowed by the Web ACL rules.

## Auditing made easy with CloudTrail

**Who** made the API call?

**When** was the API call made?

**What** was the API call?

**What** were the resources that were acted up on in the API call?

**Where** was the API call made from?

# AWS CloudTrail

*Web service that records AWS API calls for your account and delivers logs.*

Who?	When?	What?	Where to?	Where from?
Bill	3:27pm	Launch Instance	us-west-2	72.21.198.64
Alice	8:19am	Added Bob to admin group	us-east-1	127.0.0.1
Steve	2:22pm	Deleted DynamoDB table	eu-west-1	205.251.233.176

```

# AWS CloudWatch

*Monitoring services for AWS Resources and AWS-based Applications.*

## What does it do?

Collect and Track Metrics

Monitor and Store Logs

Set Alarms (react to changes)

View Graphs and Statistics

## How can you use it?

Monitor CPU, Memory, Disk I/O, Network, etc.

CloudWatch Metrics

React to application log events and availability

CloudWatch Logs / CloudWatch Events

Automatically scale EC2 instance fleet

CloudWatch Alarms

View Operational Status and Identify Issues

CloudWatch Dashboards

# VPC Flow Logs

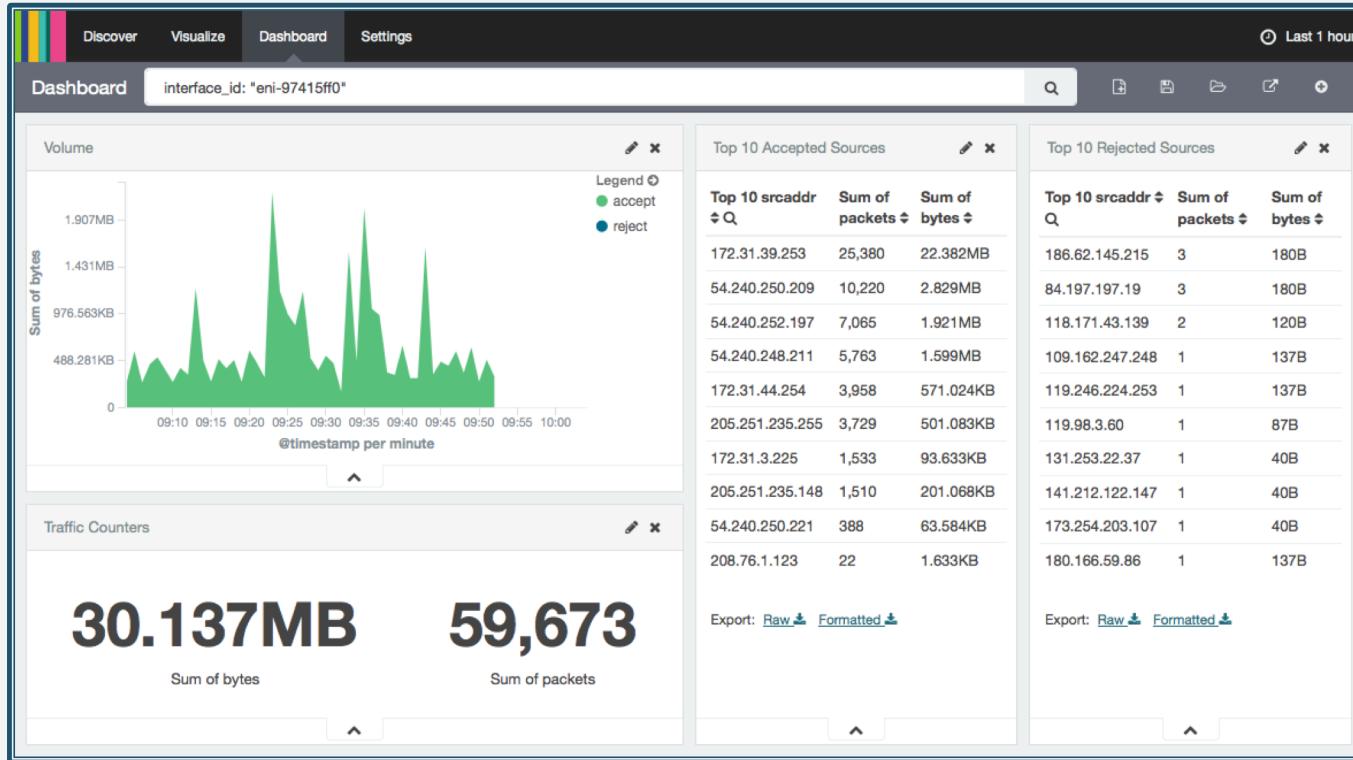

- Agentless
- Enable per ENI, per subnet, or per VPC
- Logged to AWS CloudWatch Logs
- Create CloudWatch metrics from log data
- Alarm on those metrics

The screenshot shows a table of VPC flow log data. The columns are labeled: Interface, Source IP, Source port, Protocol, Packets, Destination IP, Destination port, Bytes, and Start/end time. The 'Event Data' section contains several log entries. An arrow points from the 'AWS account' label to the first log entry. Another arrow points from the 'Accept or reject' label to the last log entry.

Interface	Source IP	Source port	Protocol	Packets	Destination IP	Destination port	Bytes	Start/end time
<b>Event Data</b>								
▼ 2 41747	eni-b30b9cd5	119.147.115.32	10.1.1.179	6000	22	6	1	40 1442975475 1442975535 REJECT OK

### Security Checks

- ▶ **Security Groups - Specific Ports Unrestricted** Updated: Dec 22, 2014 6:32 AM

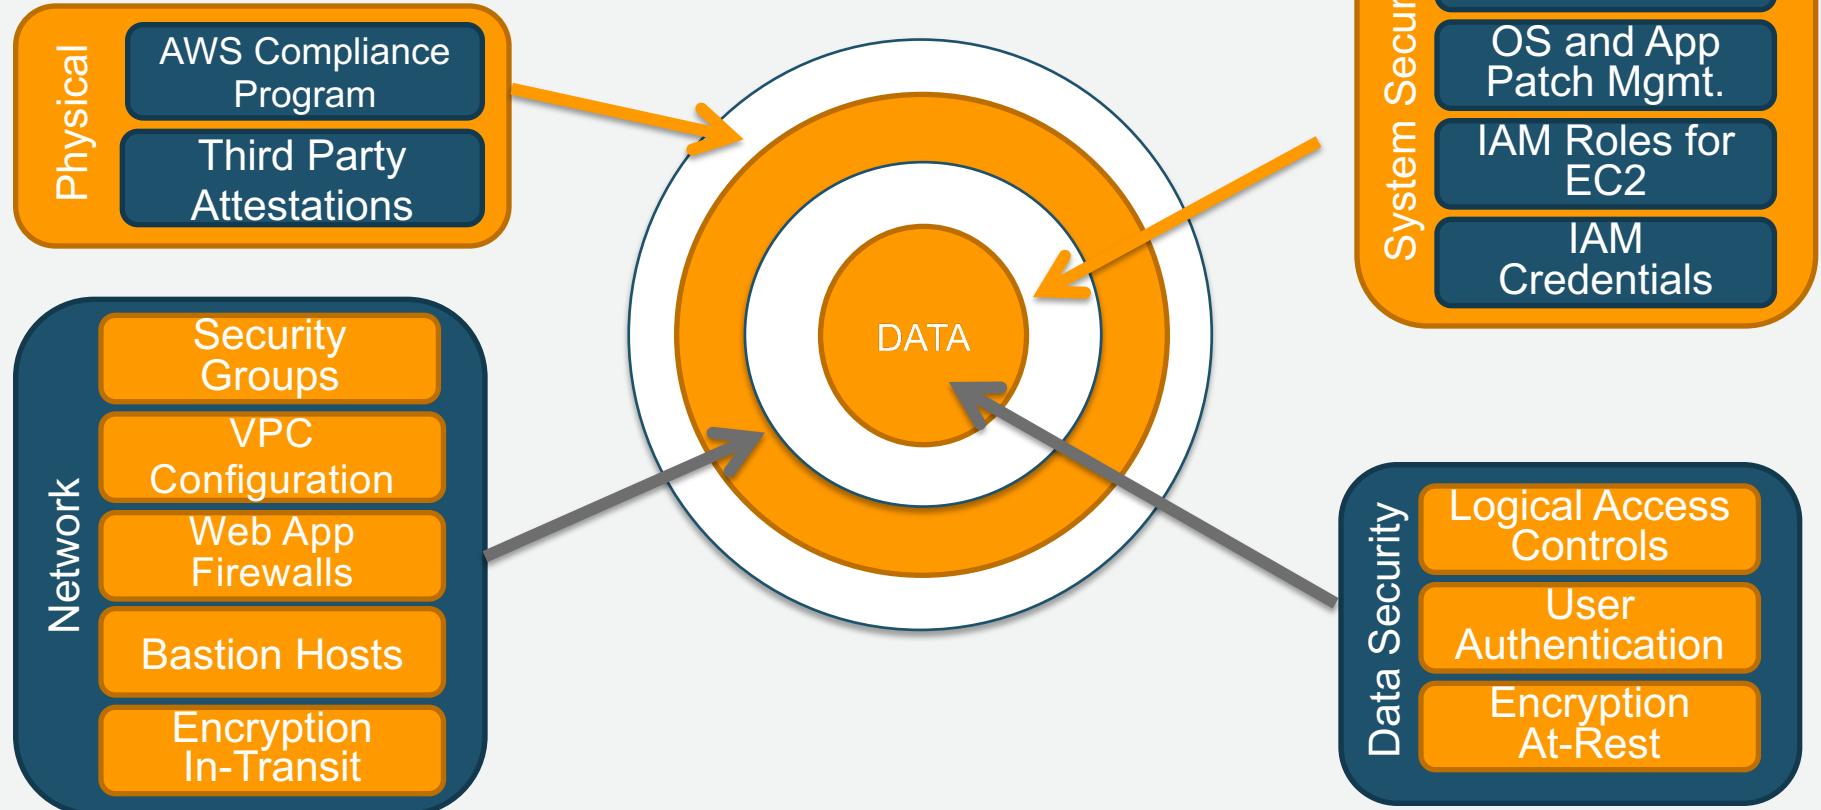

Checks security groups for rules that allow unrestricted access (0.0.0.0/0) to specific ports.  
44 of 124 security group rules allow unrestricted access to a specific port.
- ▶ **Security Groups - Unrestricted Access** Updated: Dec 22, 2014 6:24 AM

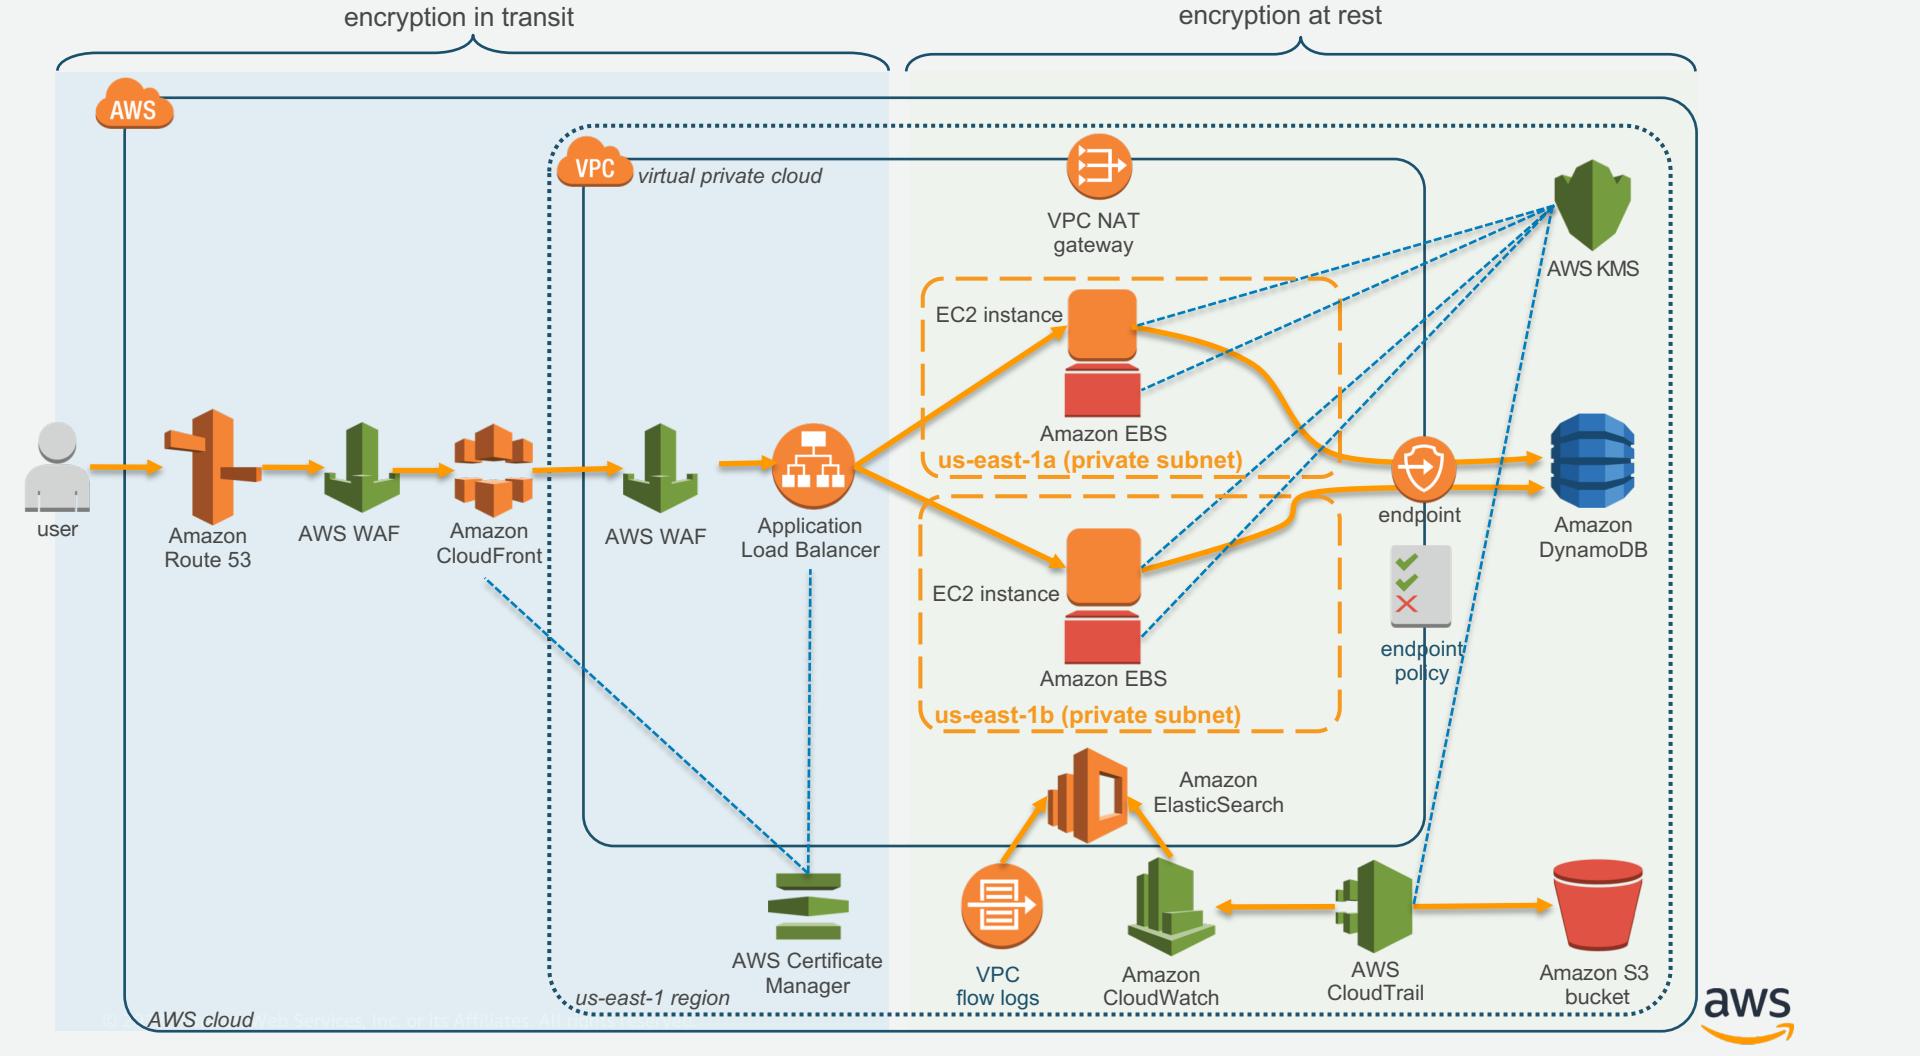

Checks security groups for rules that allow unrestricted access to a resource.  
47 of 124 security group rules have a source IP address with a /0 suffix. 1 items have been excluded.
- ▶ **Amazon S3 Bucket Permissions** Updated: Dec 22, 2014 6:24 AM

Checks buckets in Amazon Simple Storage Service (Amazon S3) that have open access permissions.

# AWS Security Center

*Comprehensive security portal to provide a variety of security notifications, information and documentation.*

<http://aws.amazon.com/security>

A screenshot of a web browser displaying the AWS Security Center homepage. The URL in the address bar is "aws.amazon.com/security/". The page features a navigation bar with links for "Menu", "Products", "Solutions", "Software", "Pricing", "More", "English", "My Account", and "Sign In to the Console". On the left, there's a sidebar with sections for "ABOUT AWS" (AWS Security Center, Security Resources, Vulnerability Reporting, Penetration Testing, Report Suspicious Emails, Security Bulletins), "RELATED LINKS" (AWS Compliance, AWS Architecture Center, AWS Security Blog), and a video player showing a testimonial from JD Sherry. The main content area has a heading "AWS Security Center" and text explaining the cloud's flexibility and security. It also includes sections for "World-Class Protection" and "Report Suspicious Emails".

The AWS cloud infrastructure has been architected to be one of the most flexible and secure [cloud computing](#) environments available today. It provides an extremely scalable, highly reliable platform that enables customers to deploy applications and data quickly and securely.

With the AWS cloud, not only are infrastructure headaches removed, but so are many of the security issues that come with them. AWS's world-class, highly secure data centers utilize state-of-the-art electronic surveillance and multi-factor access control systems. Data centers are staffed 24x7 by trained security guards, and access is authorized strictly on a least privileged basis. Environmental systems are designed to minimize the impact of disruptions to operations. And multiple geographic regions and Availability Zones allow you to remain resilient in the face of most failure modes, including natural disasters or system failures.

The AWS virtual infrastructure has been designed to provide optimum availability while ensuring complete customer privacy and segregation. For a complete list of all the security measures built into the core AWS cloud infrastructure, platforms, and services, please read our [Overview of Security Processes](#) whitepaper.

  
JD Sherry, Trend Micro  
"When we were looking for a technology provider... we didn't have to look very far to determine which platform provider can provide high availability and a **security fabric** that would meet our mission-critical needs." - JD Sherry, VP of Technology, Trend Micro

Developer Information, Articles and Tutorials,  
Security Products, and Whitepapers

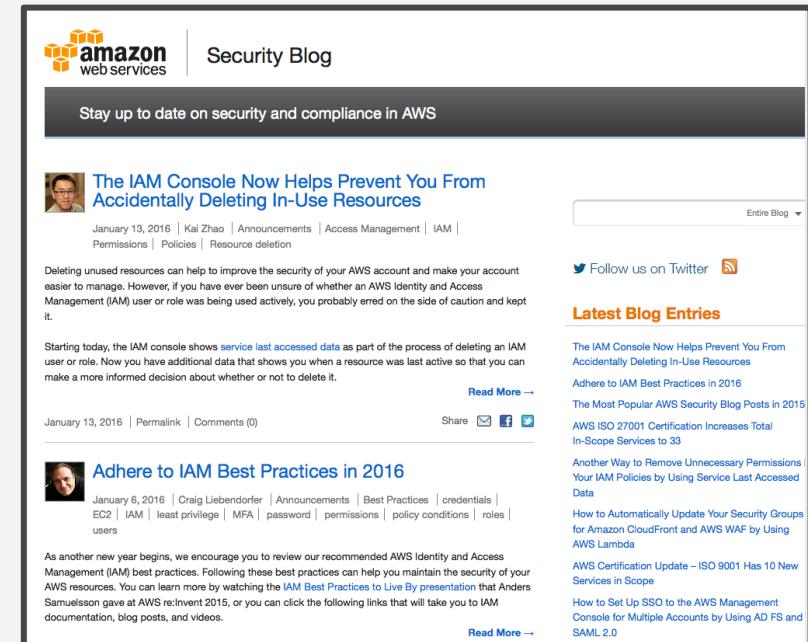

The screenshot shows the AWS Security Resources page. At the top, there's a navigation bar with 'Menu', the Amazon logo, 'Products More', 'English', 'My Account', and a 'Sign In to the Console' button. Below the navigation is a sidebar with sections like 'SECURITY' (AWS Cloud Security, Benefits of AWS Security, Security Guidance, Security Bulletins, **Security Resources**, Partner Solutions) and 'RELATED LINKS' (AWS Cloud Compliance, AWS Architecture, AWS Security Blog, Penetration Testing, Vulnerability Reporting). The main content area has a heading 'Security Resources' with a 'Contact AWS Sales' button. It contains text about security features and links to developer documents. A list of security settings for EC2, S3, and other services is provided, along with a diagram of a hexagon with red and white segments. Below this is an 'Articles & Tutorials' section with a link to 'Amazon S3 Bucket Public Access Considerations'.

# AWS Security Blog

<http://blogs.aws.amazon.com/security/>

Subscribe to the blog – it's a great way to stay up-to-date on AWS security and compliance.

The screenshot shows the AWS Security Blog homepage. At the top, there's the Amazon logo and a 'Security Blog' section. Below is a header 'Stay up to date on security and compliance in AWS'. The first post is titled 'The IAM Console Now Helps Prevent You From Accidentally Deleting In-Use Resources' by Kai Zhao, dated January 13, 2016. It includes a photo of Kai Zhao, a list of tags (January 13, 2016 | Kai Zhao | Announcements | Access Management | IAM | Permissions | Policies | Resource deletion), and a summary about IAM console improvements. Below the post is a 'Read More →' link and sharing options. To the right, there's a sidebar with 'Latest Blog Entries' and links to various posts. At the bottom right is the AWS logo.
